01.10.2008 - (idw) Fraunhofer-Institut für Algorithmen und Wissenschaftliches Rechnen SCAI

Brussels, October 1, 2008 - BEinGRID, Europe's largest research project in the field of Grid Computing, releases a free booklet of compiled case studies and background information. Learn how to make your business more efficient and reduce IT costs using distributed computing. With increasing demand from business for higher efficiency, business agility, and lower cost, for several years information communication technologies have been shifting from static silos with manually managed applications towards dynamic virtual shared environments. BEinGRID (Business Experiments in GRID) aims to support this development by fostering the adoption of Grid technologies across the EU and stimulating research into associated innovative business models.

The use of Grid technology brings many benefits such as better utilisation of IT resources, security enhancements and increased flexibility due to global access to resources through standard web-browsers. Especially in the manufacturing sector, Grid Computing can speed up interactions between designers, specialized research groups and suppliers, by providing quick access to shared relevant data and high-performance computing resources.

Despite these benefits, the commercial exploitation of Grid solutions across the European Union is still being kept back by the lack of reference cases to persuade potential users. BEinGRID has undertaken a series of targeted Business Experiments across a broad
